Consequences of quantum fluctuations for cosmology according to unimodular quantum gravity

Natascha Riahi

Faculty of Physics University of Vienna

Fourth Annual Conference of COST Action CA18108 Rijeka, July 2023

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Program

- Use Unimodular Gravity as starting point for quantization.
- Focus on flat FLRW models with a scalar field representing the matter content.
- analyze the solutions and their spreading behaviour.
- try to give an estimate for the consequences of quantum fluctuations for cosmological predictions.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Quantum Gravity and Quantum Cosmology

The canonical quantization of Einsteins theory leads to the Wheeler de Witt equation (WDW) - a functional differential equation.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Quantum Gravity and Quantum Cosmology

The canonical quantization of Einsteins theory leads to the Wheeler de Witt equation (WDW) - a functional differential equation.

► Applying the simplifications of a homogeneous and isotropic universe: WDW → partial differential equation.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Quantum Gravity and Quantum Cosmology

The canonical quantization of Einsteins theory leads to the Wheeler de Witt equation (WDW) - a functional differential equation.

► Applying the simplifications of a homogeneous and isotropic universe: WDW → partial differential equation.

Structural problems: time vanishes, no positive definite scalar product , no unitary time evolution.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

1. The Bohmian Strategy Time from guidance

condition of the classical Hamilton-Jacobi Theory:

$$rac{\partial L}{\partial \dot{q}} = p = rac{\partial S}{\partial q}$$
 , where $\Psi = R e^{iS/\hbar}$

- advantage: Time emerges naturally from the canonical structure of the theory
- disadvantage: still no positive definite scalar product, no useful notion of uncertainty

1. The Bohmian Strategy Time from guidance condition of the classical Hamilton-Jacobi Theory:

$$rac{\partial L}{\partial \dot{q}} = p = rac{\partial S}{\partial q}$$
, where $\Psi = Re^{iS/\hbar}$

- advantage: Time emerges naturally from the canonical structure of the theory
- disadvantage: still no positive definite scalar product, no useful notion of uncertainty

2. Matter as Clock Using one matter variable as "time".

- advantage: Choice of scalar product and self-adjoint time evolution possible
- disadvantage: one canonical variable is taken out and declared as "time".

An alternative: Unimodular Gravity

Quantize Unimodular Gravity

fully equivalent to Einsteins Relativity on the classical level

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

An alternative: Unimodular Gravity

Quantize Unimodular Gravity

▶ fully equivalent to Einsteins Relativity on the classical level

No need to reconstruct time- time does not vanish

An alternative: Unimodular Gravity

Quantize Unimodular Gravity

fully equivalent to Einsteins Relativity on the classical level

No need to reconstruct time- time does not vanish

► It was possible to define a scalar product and conditions for a self-adjoint time evolution for a flat Friedmann universe filled with a scalar field.

Quantization of unimodular gravity

There is no Hamiltonian constraint!

Quantization of unimodular gravity

There is no Hamiltonian constraint!

The theory yields a Schrödinger like equation

$$i\hbar \frac{\partial}{\partial t}\Psi = \int \widehat{\mathcal{H}_0} dx^3 \Psi,$$

with $\Psi[h_{ab}, t]$

Quantization of unimodular gravity

There is no Hamiltonian constraint!

The theory yields a Schrödinger like equation

$$i\hbar \frac{\partial}{\partial t}\Psi = \int \widehat{\mathcal{H}}_0 dx^3 \Psi,$$

with $\Psi[h_{ab}, t]$

In the case of reduced models there is not any constraint at all.

Spatially flat Friedmann universe with a scalar field

The Model:

spacetime:

matter:

$$egin{aligned} ds^2&=-\mathit{N}^2(t)dt^2+a^2(t)d\Omega_3^2\ d\Omega_3^2\dots 3 ext{-dim.} ext{ flat space}\ det \,g_{\mu
u}\stackrel{!}{=}-1 o \mathit{N}=1/a^3 \end{aligned}$$

Lagrangian of the field
$$\phi$$

 $L_{matter} = N a^3 \left(\frac{\dot{\phi}^2}{2N^2c^2} - V(\phi) \right)$

- in general there exists no baratropic fluid equation for the scalar field
- exact equivalence between massless scalar field and stiff matter

$$c^2\rho = p = \frac{\phi^2}{2}$$

Unimodular Hamiltonian cosmology

Hamiltonian of a spatially flat Friedmann universe with scalar field :

$$H_{uni} = \frac{c^2}{2} \frac{p_{\phi}^2}{v_0 a^6} - \frac{c^2}{v_0 4\epsilon} \frac{p_a^2}{a^4} + v_0 V(\phi). \qquad (\epsilon = 3c^4/(8\pi G) = 3/\kappa)$$

No Hamiltonian constraint, H_{uni} is a conserved quantity!

Unimodular Hamiltonian cosmology

Hamiltonian of a spatially flat Friedmann universe with scalar field :

$$H_{uni} = \frac{c^2}{2} \frac{p_{\phi}^2}{v_0 a^6} - \frac{c^2}{v_0 4\epsilon} \frac{p_a^2}{a^4} + v_0 V(\phi). \qquad (\epsilon = 3c^4/(8\pi G) = 3/\kappa)$$

No Hamiltonian constraint, H_{uni} is a conserved quantity!

Choice: $H_{uni} \equiv -\Lambda \epsilon v_0/3$,

so that Λ assumes the value of the cosmological constant in general relativity.

Unimodular Hamiltonian operator

canonical quantization:

$$\hat{p}_{a} = -i\hbar \frac{\partial}{\partial a}, \quad \hat{p}_{\phi} = -i\hbar \frac{\partial}{\partial \phi}, \quad (2)$$

factor ordering that yields a Laplace Beltrami operator

$$\Rightarrow$$
 (3)

$$\widehat{H} = \frac{\hbar^2 c^2}{4 v_0 \epsilon} \frac{1}{a^5} \frac{\partial}{\partial a} a \frac{\partial}{\partial a} - \frac{\hbar^2 c^2}{2 v_0} \frac{1}{a^6} \frac{\partial^2}{\partial \phi^2} + v_0 V(\phi) , \qquad (4)$$

symmetric with respect to the measure $a^5 da d\phi$ (5)

▲□▶ ▲御▶ ▲臣▶ ▲臣▶ 三臣 - のへで

Coordinate transformation:

$$A = a^{3}/3 \qquad B = \frac{3}{\sqrt{2\epsilon}}\phi \quad \Rightarrow$$
$$\widehat{H} = \frac{\hbar^{2}c^{2}}{v_{0}4\epsilon} \left\{ \frac{1}{A} \frac{\partial}{\partial A} A \frac{\partial}{\partial A} - \frac{1}{A^{2}} \frac{\partial^{2}}{\partial B^{2}} \right\} ,$$
measure: $A \, dA \, dB$

Lightcone coordinates

$$u = Ae^{-B} \qquad v = Ae^{B},$$
$$\widehat{H} = \frac{\hbar^{2}c^{2}}{v_{0} \epsilon} \frac{\partial^{2}}{\partial u \partial v} + v_{0} V\left(\frac{u}{v}\right)$$
measure *du dv*
$$u \in (0, \infty), v \in (0, \infty)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Lightcone coordinates

$$u = Ae^{-B} \qquad v = Ae^{B},$$
$$\widehat{H} = \frac{\hbar^{2}c^{2}}{v_{0} \epsilon} \frac{\partial^{2}}{\partial u \partial v} + v_{0} V\left(\frac{u}{v}\right)$$
measure du dv
$$u \in (0, \infty), v \in (0, \infty)$$

Classical Hamiltonian in light cone coordinates:

$$H = -\frac{c^2}{\epsilon v_0} p_u \, p_v + v_0 \, V \left(\frac{u}{v}\right) \, .$$

Schrödinger equation of unimodular quantum cosmology

$$\frac{\hbar^2 c^2}{v_0 \epsilon} \frac{\partial^2}{\partial u \partial v} \psi + v_0 V\left(\frac{u}{v}\right) \psi = i\hbar \frac{\partial}{\partial t} \psi$$

Conventional probability interpretation for unitary time evolution possible !

Condition for the unitary time evolution

requirement on the wavefunction:

$$rac{d}{dt}\langle\psi|\widehat{H}^n|\psi
angle=0 \quad {
m for} \quad n=2,3,\ldots \,.$$

sufficient condition:

$$\psi(0,\mathbf{v},t)=C(t)f_1(\mathbf{v})\qquad \psi(u,0,t)=C(t)f_2(u)\,,$$

where $f_1(x)$, $f_2(x)$ are real functions with $f_1(0) = \pm f_2(0)$ and C(t) is arbitrary.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Constructing solutions for an arbitrary scalar field

Search for eigenstates:

$$\frac{1}{v_0}\frac{\partial^2}{\partial u \partial v}\psi_{\Lambda}(u,v) + v_0 V\left(\frac{u}{v}\right) = -\frac{\Lambda \epsilon v_0}{3}\psi_{\Lambda}(u,v)$$

with the boundary conditions

$$\psi_{\Lambda}(0,x) = f_1(x) \qquad \psi_{\Lambda}(x,0) = f_2(x),$$

where $f_1(x), f_2(x)$ are real functions. We construct wavepacket solutions by superposition

$$\psi(u,v,\tau) = \int_{-\infty}^{\infty} e^{i t \frac{\Lambda \epsilon v_0}{3}} \psi_{\Lambda}(u,v) F(\Lambda) \, d\Lambda \, .$$

◆□▶ ◆□▶ ◆目▶ ◆目▶ ▲□ ◆ ��や

We obtain for the time evolution at the edges

$$\psi(0, v, \tau) = C(\tau)f_1(v) \qquad \psi(u, 0, \tau) = C(\tau)f_2(u)$$

where
$$C(\tau) = \int_{-\infty}^{\infty} e^{i t \frac{\Lambda \epsilon v_0}{3}} F(\Lambda) d\Lambda.$$

- The solutions meet the condition for the unitary time evolution!
- For late times: asymptotic boundary conditions

$$\lim_{\tau\to\infty}\psi(u,0,t)=\lim_{\tau\to\infty}\psi(0,v,t)=0\,.$$

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

Analysis of the dynamics of the expectation values

The Heisenberg equations

$$\frac{d}{dt}\langle\psi|\widehat{O}|\psi\rangle = -\frac{i}{\hbar}\langle\psi|\left[\widehat{O},\widehat{H}\right]|\psi\rangle$$
(6)

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

apply only in the asymptotic future

$$t \ll \frac{\Lambda \epsilon v_0}{\hbar} = \frac{3\Lambda v_0 c^4}{8\pi G \hbar}$$

Analysis of the dynamics of the expectation values

The Heisenberg equations

$$\frac{d}{dt}\langle\psi|\widehat{O}|\psi\rangle = -\frac{i}{\hbar}\langle\psi|\left[\widehat{O},\widehat{H}\right]|\psi\rangle$$
(6)

apply only in the asymptotic future

$$t \ll \frac{\Lambda \epsilon v_0}{\hbar} = \frac{3\Lambda v_0 c^4}{8\pi G \hbar}$$

 dynamical analysis independent of concrete wavefunction is only possible for late times.

in this quasiclassical time-regime, the expectation values obey the classical dynamics provided the uncertainties remain small.

Analysis of the uncertainty dynamics

- Consider an expansion of the terms depending on $V\left(\frac{u}{v}\right)$ about the (classical) expectation values
- take no higher order terms than $(\Delta u)^2, (\Delta v)^2, \Delta(u, v)$
- get a non-autonomous system of 10 linear equations for the uncertainties.

$$\mu = c^2/\epsilon = 2\pi G/(3c^2)$$

It contains the time-dependent functions

. . .

$$V_{11}(t) = rac{\partial^2 V}{\partial v^2}, \quad V_{22}(t) = rac{\partial^2 V}{\partial u^2} \quad V_{12}(t) = rac{\partial^2 V}{\partial v \partial u}$$

which are taken at the classical values $u(t), v(t), \ldots = v_{0}$

Analysis of the dynamical system

$$\begin{aligned} \frac{d}{dt} \overrightarrow{\Delta} &= \mathcal{M}(t) \cdot \overrightarrow{\Delta} \\ \overrightarrow{\Delta} &= \left\{ (\Delta u)^2, (\Delta v)^2, \Delta (u, v), (\Delta p_u)^2, (\Delta p_v)^2, \\ \Delta (p_u, p_v), \Delta (u, p_u), \Delta (v, p_v), \Delta v, p_u, \Delta (u, p_v) \right\} \end{aligned}$$

The analysis requires the behaviour of $\mathcal{M}(t)$ fot $t \to \infty$

\Rightarrow Knowledge of classical late time behaviour necessary!

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Results for uncertainty dynamics

the stiff matter case:

$$\mathcal{M}_0 \equiv \mathcal{M} \Big|_{\mathbf{V}=\mathbf{0}}$$

The system is autonomous. Uncertainties are growing with leading order t^2 .

the general case:

$$\mathcal{M} = \mathcal{M}_0 + \mathcal{M}_1(t)$$

the system is unstable for $\int_{t_0}^\infty |\mathcal{M}_1(t)| < \infty$

exponential potential:

$$V = V_0 e^{\lambda \sqrt{\kappa} \phi}$$

due to classical analysis (Copeland, Liddle, Wands (1998)): $\mathcal{M}_1(t)$ integrable \rightarrow uncertainty dynamics unstable

Classical and not classical epochs

- early epoch: $t \ll \frac{3\Lambda v_0 c^4}{8\pi G\hbar}$
- intermediate epoch:

quasiclassical time evolution according to classical equation of motion with growing uncertainties no Heisenberg equations, no Ehrenfest theorem

late epoch

Growing uncertainties destroy the quasiclassical time evolution ??

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

to be analyzed

Open question

How should v_0 be determined?

Matter density fluctuations

- determine the Wigner transform of the matter density operator $\hat{\rho}$
- perform an expansion around the classical values up to order Δ^2 .

From our analysis we will assume the uncertainties grow with leading order $t^2\,$

Dark matter hypothesis

$$\langle \rho \rangle = \rho_{cl} + \Delta \rho$$

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = のへで

Dark matter hypothesis

Estimation

Dark matter ratio :

$$R(au) \equiv rac{\Delta
ho(au)}{
ho_{cl}(au)}$$

Estimation

Dark matter ratio :

$$R(au) \equiv rac{\Delta
ho(au)}{
ho_{cl}(au)}$$

Rough estimation for a matter dominated universe and uncertainties $\sim t^2$

$$\frac{R(\tau_2)}{R(\tau_1)} = \left(\frac{\tau_2}{\tau_1}\right)^6 = \frac{(1+z_2)^9}{(1+z_1)^9}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Estimation

Dark matter ratio :

$$R(\tau) \equiv \frac{\Delta \rho(\tau)}{\rho_{cl}(\tau)}$$

Rough estimation for a matter dominated universe and uncertainties $\sim t^2$

$$\frac{R(\tau_2)}{R(\tau_1)} = \left(\frac{\tau_2}{\tau_1}\right)^6 = \frac{(1+z_2)^9}{(1+z_1)^9}$$

Conclusion: Increasing dark mater ratio for increasing uncertainties!
