# Neutrino Interactions

- ASFAE project: Modeling neutrino interactions with matter for current and future experiments

# Neutrino Interactions

C. Wilkinson

- Need for neutrino interaction **theory**:
- **Experiments** (partially) rely on **theory-based** simulations for:
  - background subtraction
  - flux calibration
  - $E_\nu$  reconstruction ( $\nu$  beams are **not monochromatic**)
  - efficiency and acceptance determination
  - $\sigma(\nu_\mu)$  to  $\sigma(\nu_e)$  , **target** extrapolations
  - future projections
- Mismodeling can lead to **systematic errors** even with the best data.

# Neutrino interaction theory

C. Wilkinson

- @ IFIC: 15+ years developing advanced theoretical models and simulations of few-GeV neutrino interaction with matter:
  - Quasi-elastic scattering on nuclear targets.
  - Two-body currents.
  - Meson production on nucleons and nuclei.
  - Photon emission
  - Coherent processes
  - Strangeness production
  - Deep inelastic scattering

# Neutrino interaction theory

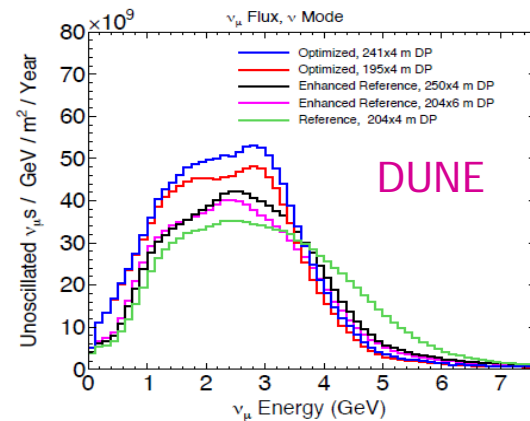

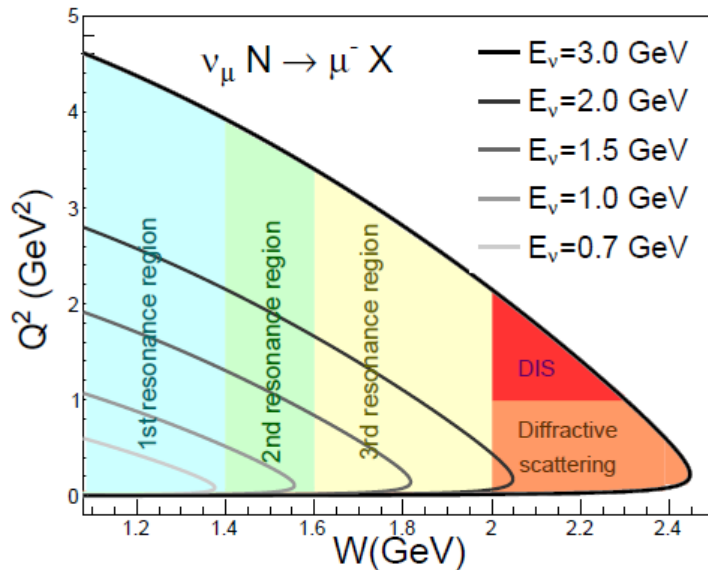

- ASFAE project: Modeling neutrino interactions with matter for current and future experiments

## Current activity:

- Weak pion production of the nucleon over a broad kinematic range.  
Collaborator: M. Gorchtein (Mainz)
- Target mass dependence of CC coherent pion production.
- Photon emission in NC interactions with nucleon knockout.  
Collaborator: M. Benítez (Granada)
- Meson production in  $\bar{\nu} e^-$  collisions at FASER $\nu$  (CERN).
- NC neutrino-nucleon scattering in presence of non-standard interactions.  
Collaborators: Ilma, M. Rafi Alam (Aligarh), I. Ruiz Simó (Granada)
- Weak hyperon production (including FCNC searches) .  
Collaborators: M. Rafi Alam (Aligarh), M. Benítez, I. Ruiz Simó (Granada)
- New physics in charmed hyperon production by CC  $\nu_\tau$  interactions.  
Collaborator: J. Sobczyk (Mainz)

# Modeling neutrino interactions

- Weak pion production of the nucleon over a broad kinematic range.  
Collaborator: M. Gorchtein (Mainz)
- The most important inelastic process
  - Source of background eg  $NC\pi^0$  in Cherenkov detectors
- Proceeds predominantly through the excitation of **nucleon resonances**

- Mainz Unitary Isobar Model for Pion Photo- and Electroproduction on the Nucleon (MAID) **extended** to the **axial** sector.
  - To be implemented in **GENIE**.

# Modeling neutrino interactions

- Photon emission in NC interactions with nucleon knockout.

Collaborator: M. Benítez (Granada)

- Electronlike background

- Candidate to explain the MiniBooNE anomaly

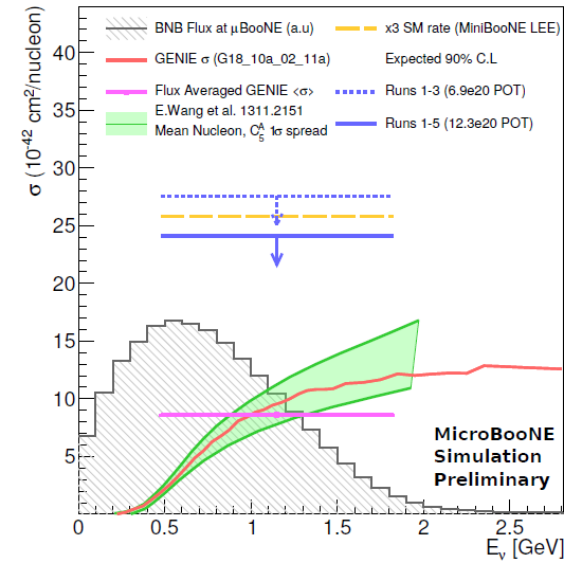

- SM and BSM mechanisms

- Upper bounds by T2K and MicroBooNE →

- Our task: Extend our study of  $\nu(\bar{\nu}) A \rightarrow \nu(\bar{\nu}) \gamma X$  to the exclusive  $\gamma p$  channel

- Comparisons to MicroBooNE and SBND future data

- Test the role of heavier BSM mediators:

K. Sutton, PoS (NuFact 2021)

- Total
- QE with proton
- Coherent with  $^{12}\text{C}$
- Incoherent with  $^{12}\text{C}$

# Modeling neutrino interactions

- NC neutrino-nucleon scattering in presence of non-standard interactions.  
Collaborators: Ilma, R. Alam (Aligarh), I. Ruiz Simó (Granada)
- Non-standard/generalized  $\nu$  interactions can be (potentially) accessed in:

- Oscillations (matter effects)
- $\tau, \beta$ , (heavy) hadron semi-leptonic decays
- $\nu$  scattering:  $\nu$ -e, CE $\nu$ NS, DIS

- Other possibilities: eg  $\nu p \rightarrow \nu p$

$$\langle p | J^\mu | p \rangle = \bar{u}(p') \Gamma^\mu u(p) = \mathcal{V}^\mu - \mathcal{A}^\mu$$

$$\Gamma^\mu = \gamma^\mu \tilde{F}_1^{(p)} + \frac{i}{2M} \sigma^{\mu\nu} q_\nu \tilde{F}_2^{(p)} - \gamma^\mu \gamma_5 \tilde{F}_A^{(p)}$$

- In presence of NSI:

$$\tilde{F}_{1,2}^{(p)} = \left( \frac{1}{2} - 2s_W^2 + 2\epsilon^{uV} + \epsilon^{dV} \right) F_{1,2}^{(p)} + \left( -\frac{1}{2} + 2\epsilon^{dV} + \epsilon^{uV} \right) F_{1,2}^{(n)} - \frac{1}{2} F_{1,2}^{(s)}$$

$$2\tilde{F}_A^{(p)} = (1 + \epsilon^{uA} - \epsilon^{dA}) F_A^{iv} + (\epsilon^{uA} + \epsilon^{dA}) F_A^{is} - F_A^{(s)}$$

- Reliable (flavor decomposed) input from LQCD required
- Complementary to DIS

# Weak hyperon production

- $\Delta S = -1$ :  $W^- u \rightarrow s$
- Cabibbo reduced ( $V_{us} = 0.23$ )
- Via  $Y \rightarrow \pi N$ ,  $Y$  are a source of low energy  $\pi$  in  $\bar{\nu}$  scattering
- $Y$  production could be used to constrain  $\bar{\nu}$  contamination in  $\nu$  beams

# Comparison to MicroBooNE

$$\bar{\nu}_\mu + {}^{40}\text{Ar} \rightarrow \mu^+ + \Lambda + X$$

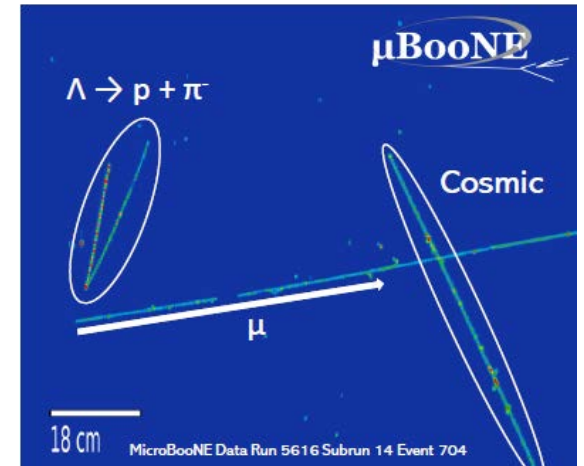

$$\bar{\nu}_\mu + {}^{40}\text{Ar} \rightarrow \mu^+ + \Lambda + X$$

- After phase space restrictions:
- Large c. s. reduction; smaller impact of FSI
- ~ 33% contribution from  $\Lambda\pi$

	$\sigma_*$ ( $\times 10^{-40}$ cm <sup>2</sup> /Ar)
MicroBooNE	$2.0^{+2.1}_{-1.6}$
QE + $Y\pi$ , full model	2.13
QE	1.44
$Y\pi$	0.69

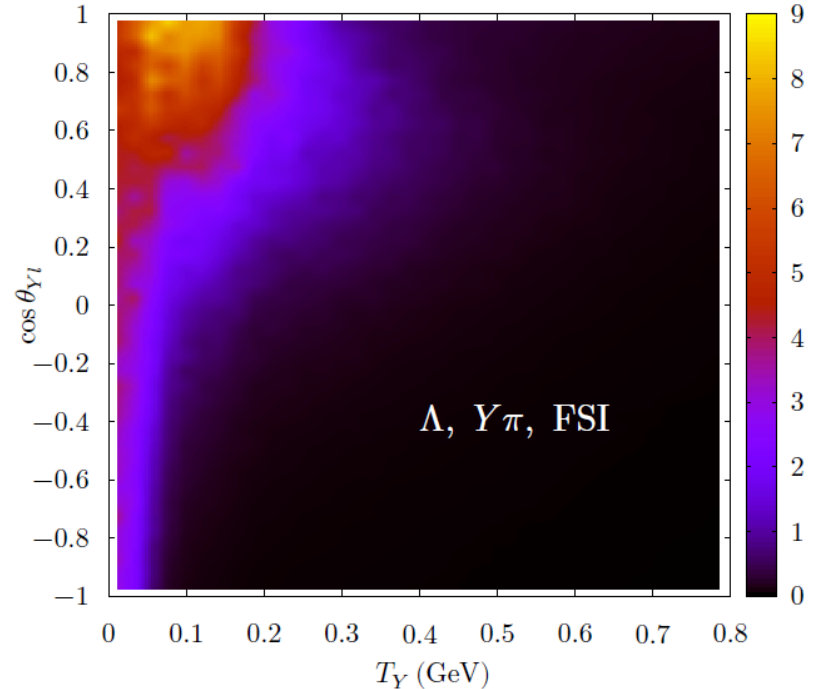

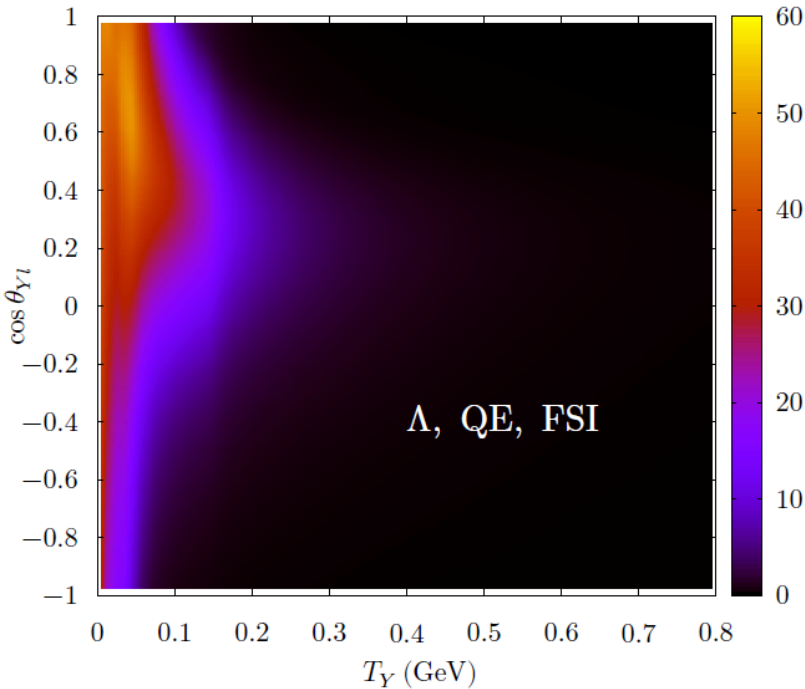

MicroBooNE, PRL 130 (2023)

# SBND

- $10\text{-}13 \times 10^{20}$  POT (3 years)
- Expected events before detection thresholds:
  - $N_{\Lambda} = 1300 - 1700$  (QE)
  - $N_{\Lambda} = 240 - 300$  ( $\Lambda\pi$ )

# FCNC searches with neutrinos

- **Suppressed** in the **SM**
- **Constraints** from **K** decays:
  - $\epsilon_V < 10^{-6} \approx 0$ ;  $|\epsilon_A| < 7.6 \times 10^{-3}$
- At **SBND**
- $d \rightarrow s$  using  $\nu_l n \rightarrow \nu_l \Lambda$   
 $\nu_l p \rightarrow \nu_l \Sigma^+$
- $N_{\text{FCNC}\Lambda} \approx 466 |\epsilon_A|^2 N_{\text{CC}\Lambda}$
- With  $N_{\text{CC}\Lambda} = 1300 - 1700$  ( $\bar{\nu}$ ) and the upper bound  $|\epsilon_A| < 7.6 \times 10^{-3}$
- $N_{\text{FCNC}\Lambda} < 46 - 60$  events (x 3)
- At **DUNE**
  - More possible final states:  $\nu_l N \rightarrow \nu_l Y, Y \pi, N' \bar{K}, N' \bar{K} \pi$
  - More statistics (particularly with a **gas TPC**)
  - Background from  $\nu_l N \rightarrow \nu_l Y K$

# Outlook

- Line 6: Neutrinos
  - Sound contributions to neutrino and astroparticle physics experiments:
    - T2K, HK, DUNE, KM3NeT, NEXT
- ASFAE project: Modeling neutrino interactions with matter for current and future experiments
  - Making progress in our understanding of neutrino interactions with matter in the SM
  - Searching for processes and observables sensitive to BSM non-standard and flavor changing NC interactions
